HAC®
High Angle Conveyor
Product Overview
Since the early 1980’s, the Joy HAC (High Angle Conveyor) has proven itself to be a versatile and money saving method for elevating or lowering materials continuously from one level to another at extremely steep angles.

Over the years, the HAC has been successfully used in a variety of commercial applications, conveying a wide range of materials. These have included coal, tunnel muck, gravel, wood chips, copper ore, gypsum, slag, excavated silts, sands, clay, grains, refuse, and municipal sludge, among other materials.

The Joy HAC has taken the sandwich-belt concept, and turned it into a highly reliable materials handling workhorse – the result of specific engineering breakthroughs. One of the secrets to the high performance capabilities of the Joy HAC technology is its use of pressing components. The fully-equalized pressing mechanism secures material toward the center of the belt while gently, but effectively, sealing the belt edges together. The HAC system holds the conveyed material continually — eliminating relative movement between material and belts. It does not confront materials, rather it conforms to surface shapes without incurring high local forces. Soft, gentle pressure assures the preservation of product quality and long life for the equipment.
Plus, The Advantage of Standard Conveyor Idlers And Rolls

The use of standard conveyor idlers and rolls in the HAC system means replacement of these components is quick and easy. HAC systems in place around the world have demonstrated high availability and low maintenance costs.

The HAC lends itself to multi-module conveying systems using self-contained units, as well as single-run systems using externally anchored high angle conveyors. In both cases the conveyor unit may be shortened or lengthened or the conveying angle may be altered according to the requirements of a new location. High Angle Conveyors may be mounted on rails, rubber tired or crawler type transporters.

Standard, smooth surface belts allow continuous cleaning by belt scrapers or plows. This is especially important in handling wet and sticky material.

Versatile, Adaptable, And Economical

The Joy HAC is a proven option for a variety of steep angle applications. Contact us for your specific application.

During operation conveyed material is sealed between the carrying and cover belts. This decreases the potential for spillage along the conveyor length.

The HAC is a proven method for conveying materials vertically from tunnelling operations to the surface.
All designs, specifications and components of the equipment described above are subject to change at the manufacturer's sole discretion at any time without advance notice. Data and descriptions published herein are informational in nature and shall not be construed to warrant the service or the suitability of the equipment for any particular purpose as performance may vary with the conditions encountered. The only warranty applicable is our standard written warranty for this equipment or service.
